

# Labs21 2003 Annual Conference

## Overcoming Barriers To and Taking Advantage Of Manifold Exhaust Systems

by Lee Chapman, P.E.  
Industrial Design and Construction, Inc.  
(864) 241-2800

October 21, 2003

03PE-9006  
IDC CONFIDENTIAL

# Labs21 Design Approach

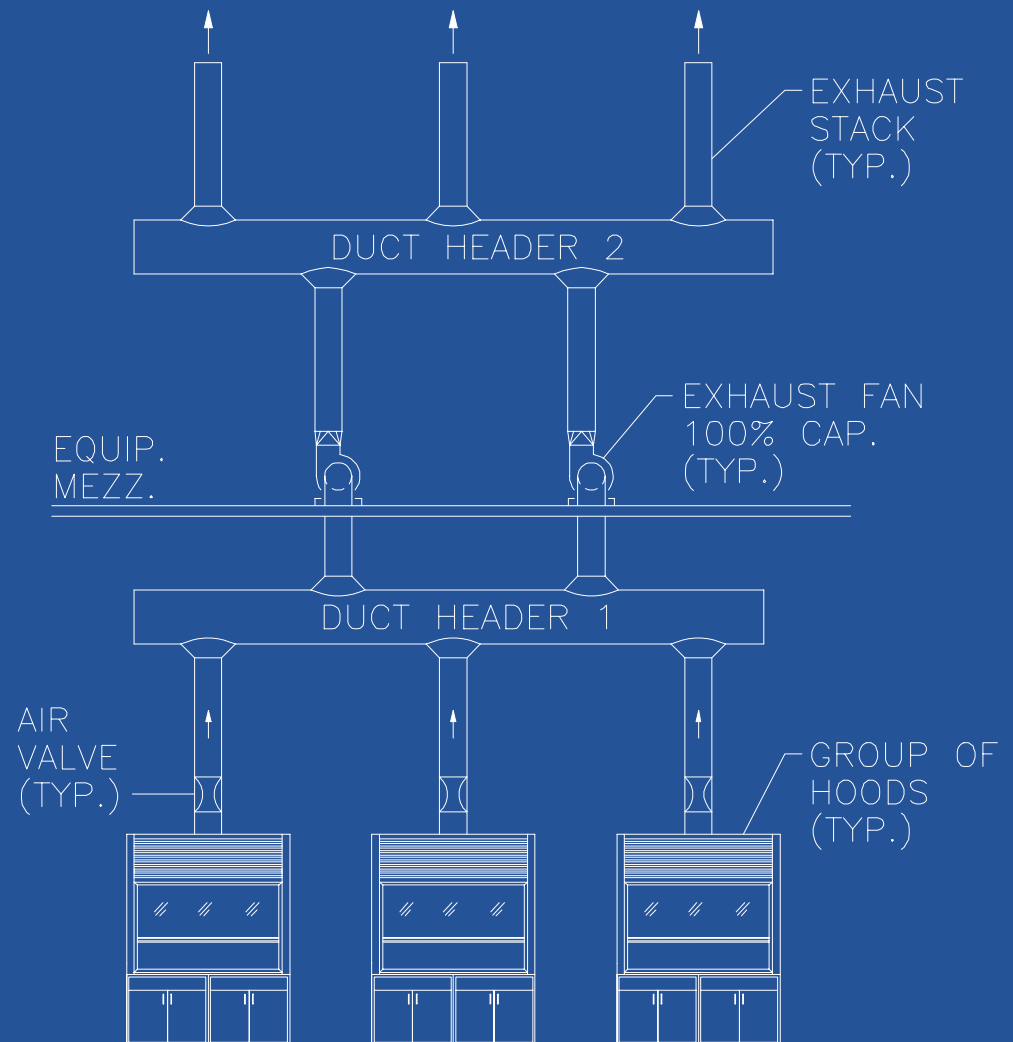

- Adopt Energy and Environmental Performance Goals.
- Assess Opportunities From a “Whole Buildings” Approach.
- Use Lifecycle Cost Decision-Making.
- Employ a Broad Range of Sustainable Energy and Water Efficiency Strategies.

03PE-9006  
IDC CONFIDENTIAL

# What is a Manifold Exhaust System?

- Combines individual exhaust streams into a common header.
- Employs two or more central exhaust fans with N+1 redundancy.
- VFDs offer energy savings at low utilization.

# Barriers to Manifold Exhaust Systems

- Code Issues.
- ANSI Standard Z9.5 Compliance:
  - Maintain 3,000 fpm discharge velocity through entire range of operation.
- Assumed Cost Implications (ductwork).
- Functional Limitations - Will it work?
- Non-conventional.

# Code Issues

- Definitions:
  - “Hazardous exhaust systems shall be independent of other types of exhaust systems.”
  - “Incompatible materials, as defined in the *International Fire Code*, shall not be exhausted through the same hazardous exhaust system.”

# Code Issues

- Definitions:
  - “INCOMPATIBLE MATERIALS. Materials that, when mixed, have the potential to react in a manner which generates heat, fumes, gases or byproducts which are hazardous to life or property.”

## A Hazardous Exhaust System Is Required. . .

“. . .wherever operations involving the handling or processing of hazardous materials, in the absence of such exhaust systems and under normal operating conditions, have the potential to create one of the following conditions:”

1. A flammable fume in concentrations exceeding 25% of the LFL of the substance.
2. A fume with a health hazard rating of 4 (any concentration).
3. A fume with a health hazard rating of 1, 2 or 3 (concentrations exceeding 1% of LC<sub>50</sub>).

# Evaporation Rate Calculation

$$W = \frac{MW \times K \times A \times P_{\text{vap}}}{R \times T}$$

$$DC = \frac{W}{Q}$$

$$K = 0.00438 \times U^{0.78} \times (18/MW)^{1/3}$$

|                  |  |
|------------------|--|
| W                | Evaporation rate [lb/min]                                  |
| MW               | Molecular Weight [lb/lb-mole]                              |
| K                | Gas-phase mass transfer coefficient                        |
| <b>A</b>         | <b>Surface area [ft<sup>2</sup>] (1 ft<sup>2</sup>)</b>    |
| P <sub>vap</sub> | Vapor pressure [psia]                                      |
| R                | Ideal gas constant [psia x ft <sup>3</sup> / °R x lb-mole] |
| T                | Temperature [°R] (based on 68 °F)                          |
| <b>U</b>         | <b>Air velocity [mph] (100 fpm)</b>                        |
| <b>Q</b>         | <b>Airflow through hood [lb/min] (350 cfm)</b>             |
| DC               | Diluted Concentration [%]                                  |

# Barriers to Manifold Exhaust Systems

- Code Issues.
- ANSI Standard Z9.5 Compliance:
  - Maintain 3,000 fpm discharge velocity through entire range of operation.
- Assumed Cost Implications (ductwork).
- Functional Limitations - Will it work?
- Non-conventional.

# Manifold Exhaust with Energy-Saving Upgrades

03PE-9006  
IDC CONFIDENTIAL

# IDC Patent - Stack Discharge Control Damper

- Velocity is measured at stack discharge by sensor 120.
- Controller 122 adjusts damper position to maintain minimum velocity (e.g. 3,000 fpm).
- Discharge geometry promotes laminar flow, thus optimizes plume height.

# "On/Off" Dampers vs. Modulating Dampers

03PE-9006  
IDC CONFIDENTIAL

# Barriers to Manifold Exhaust Systems

- Code Issues.
- ANSI Standard Z9.5 Compliance:
  - Maintain 3,000 fpm discharge velocity through entire range of operation.
- Assumed Cost Implications (ductwork).
- Functional Limitations - Will it work?
- Non-conventional.

# “Whole Building” Approach

- A manifold exhaust system offers an opportunity to bundle upgrades such as energy recovery and discharge damper control to maximize annual energy savings.
- LEED™ (Leadership in Energy and Environmental Design) encourages a “Whole Building” approach in design and identifies synergies between LEED™ credits.

# "Whole Building" Savings and Payback

03PE-9006  
IDC CONFIDENTIAL

# Benefits of Manifold Exhaust Systems

- Lower installation cost - fewer fans.
- Lower operating cost - VFDs.
- Reduced concentration in duct - dilution.
- Reduced maintenance - fewer fans to service.
- Redundancy - backup fan.
- Offers facility flexibility - future tie-ins.
- Emergency power simplification - fewer fans.
- Aesthetics - consolidate exhaust stacks.
- Reduced roof penetrations - fewer stacks.
- Reduced stack height - Higher mass flow rate.
